Priority Number: Feb. 24, 1998 RU1998000103743

Abstract:

FIELD: information displaying devices, liquid crystal cells, indicating equipment of various assignment.

SUBSTANCE: liquid-crystal indicating element includes layer of liquid crystal placed between first and second plates with electrodes, polarizers, light-forming and orientation layers. At least one polarizer has one anisotropically absorbing birefringent layer as minimum formed from asymmetric mixed salts of dichroic anion pigments containing various cations and/or associates of dichroic pigments containing ionogenic groups with at least one mole of organic ion. EFFECT: increased luminance and high uniformity of properties of liquid crystal indicating element over entire area. 23 cl, 6 dwg
